Triterpenoids and Aromatics from Derris laxiflora

Hsi-Lin Chiu,[†] Jyh-Horng Wu,[‡] Yu-Tang Tung,[§] Tzong-Huei Lee,[⊥] Shin-Chang Chien,^{||} and Yueh-Hsiung Kuo^{*,†,||,∇,#}

Department of Chemistry, Research Center of Food and Biomolecules, and School of Forestry and Resource Conservation, National Taiwan University, Taipei 106, Taiwan, Graduate Institute of Pharmacognosy, Taipei Medical University, Taipei 110, Taiwan, Department of Forestry, National Chung-Hsing University, Taichung 402, Taiwan, Agricultural Biotechnology Research Center, Academia Sinica, Taipei 115, Taiwan, and Tsuzuki Institute for Traditional Medicine, College of Pharmacy, China Medical University, Taichung 404, Taiwan, Republic of China

Received April 24, 2008

Seven new compounds, O-trans-cinnamoylglutinol (1), 22β -hydroxy-12-oleanen-3-one (2), 15α , 16α -epoxy-12-oleanen-3-one (3), 29-hydroxy-12-oleanene-3,22-dione (4), 22β,29-dihyroxy-12-oleanen-3-one (5), 2,3-(methylenedioxy)-4methoxy-5-methylphenol (8), and 2,3,6-trimethoxy-5-methylphenol (9), as well as two first isolated from natural sources, 25-cycloartene-3,24-dione (6) and 24ξ -hydroxy-25-cycloarten-3-one (7), were characterized from *Derris laxiflora*. The structures of these compounds were determined by analysis of their spectroscopic data.

Derris laxiflora Benth. (Leguminosae) is a native species found on the hills and lowlands of southern Taiwan, and its extract is used traditionally as an insecticide and piscicide.¹ Seven flavonoids, including 3'-methoxylupinifonin, laxifolin, isolaxifolin, laxichalcone, derrichalcone, derriflavanone, and epi-derriflavanone, have been isolated and identified from ethanolic extract of the roots.^{1,2} However, to the best of our knowledge there is no prior report on the constituents from whole plants of D. laxiflora. In this study, we describe the isolation and structural elucidation of five new triterpenoids (1-5), 25-cycloartene-3,24-dione (6),³ 24ξ -hydroxy-25-cycloarten-3-one (7),⁴ and two new aromatics (8, 9) from D. laxiflora.

Results and Discussion

The molecular formula of compound 1 was assigned as $C_{39}H_{56}O_2$ $(M^+; m/z 556.4271)$ by HREIMS. The IR spectrum suggested that it contained an ester (1709 cm⁻¹) and a conjugated double bond (1645 cm⁻¹). The ¹H NMR spectrum (see Experimental Section) showed eight methyl groups (each 3H, s), a trisubstituted olefinic proton [$\delta_{\rm H}$ 5.58 (br d), J = 5.6 Hz] characteristic of H-6 of the glutinane skeleton,⁵ a proton signal characteristic of H-3 [$\delta_{\rm H}$ 4.82 (1H, br t), J = 2.4 Hz], and a (*E*)-cinnamoyl group [$\delta_{\rm H}$ 6.38 and 7.61 (1H each, d, J = 16.0 Hz), $\delta_{\rm H}$ 7.36 (3H, m), $\delta_{\rm H}$ 7.48 (2H, m)] attached to a tertiary carbon. The ¹³C NMR spectrum of 1 (Table 1) was similar to those of glutinol, except that **1** showed additional signals of an (E)-cinnamoyl moiety [$\delta_{\rm C}$ 166.5 (C-1'), 118.9 (C-2'), 144.2 (C-3'), 134.6 (C-4'), 128.0 (C-5', C-9'), 128.8 (C-6'), 130.1 (C-7', C-8')]. The HMBC spectrum of 1 showed a long-range correlation between H-3 ($\delta_{\rm H}$ 4.82) and C-1' ($\delta_{\rm C}$ 166.5), and several key NOESY correlations (H₃-24/H-3, H-6; H₃-23/H-10) suggested that the *O*-trans-cinnamoyl group was attached to C-3 with β -axial orientation (Figure 1). Hence, compound 1 was established as O-trans-cinnamoylglutinol.

Compound **2** was assigned as $C_{30}H_{48}O_2$ (M⁺; *m*/*z* 440.3650) by HREIMS. The IR spectrum showed the presence of OH (3476 cm⁻¹) and carbonyl groups (1699 cm⁻¹). The ¹H NMR spectrum showed eight methyl signals (each 3H, s), an olefinic proton

characteristic of H-12 [$\delta_{\rm H}$ 5.26 (1H, t, J = 3.6 Hz)] of an oleanene skeleton,⁶ and an oxymethine proton [$\delta_{\rm H}$ 3.43 (1H, t, J = 5.2 Hz, H-22)]. The ¹³C NMR spectrum of 2 (Table 1) showed a signal of a ketone group ($\delta_{\rm C}$ 217.8) and two olefinic carbon signals ($\delta_{\rm C}$ 122.6, 143.9), which were in good agreement with those of C-12 and C-13 of olean-12-ene derivatives.⁷ The HMBC spectrum of 2 showed long-range correlations from H₃-24 ($\delta_{\rm H}$ 1.04) and H₃-23 ($\delta_{\rm H}$ 1.08) to C-3, C-4, and C-5; between H-12 ($\delta_{\rm H}$ 5.26) and C-9, C-14, and C-18; and between H₃-28 ($\delta_{\rm H}$ 0.86) and C-16, C-18, and C-22. In addition, significant NOEs were observed between H-18 and H-12, H₃-28, and H₃-30; and between H-22 and H₂-21. Accordingly, the

secondary OH group was assigned as C-22 axial, and it caused the H-18 signal to shift downfield to δ 2.09. The coupling constant of H-22 indicates that it is equatorial in orientation. Hence, compound **2** was established as 22β -hydroxyl-12-oleanen-3-one.

Compound **3** was assigned the molecular formula $C_{30}H_{48}O_2$ (M⁺; m/z 440.3649) by HREIMS. The IR spectrum showed the presence of an OH group (3423 cm⁻¹). Eight ¹H NMR signals (each 3H, s) were attributed to methyl groups. Comparison of ¹H and ¹³C NMR data of 3 with those of 2 suggested that 3 was an oleanane derivative. The ¹³C NMR signal at $\delta_{\rm C}$ 78.9 and corresponding proton signal at $\delta_{\rm H}$ 3.21 (1H, dd, J = 11.6, 4.5 Hz) were assigned as C-3 and H-3 α , respectively. In addition, two olefinic carbon signals ($\delta_{\rm C}$ 122.6, 140.4) were observed, and the calculated number of rings for 3 was seven, including a pentacyclic skeleton. Accordingly, the remaining two oxygenated carbons at $\delta_{\rm C}$ 55.6 [corresponding proton signal at $\delta_{\rm H}$ 2.89 (1H, d, J = 3.5 Hz)] and $\delta_{\rm C}$ 64.8 [corresponding proton signal at $\delta_{\rm H}$ 2.77 (1H, d, J = 3.5 Hz)] were assigned to an epoxide functionality. NOESY correlations of H₃-28/H-16 and H₃-26/H-15 indicated that both H-15 and H-16 were β -oriented, and HMBC supported the assigned structure. Thus, compound **3** was established as 15α , 16α -epoxy-12-oleanen- 3β -ol.

Compounds **4** and **5** were assigned the molecular formula $C_{30}H_{46}O_3$ and $C_{30}H_{48}O_3$, respectively, by HREIMS. The IR spectra of both compounds showed the presence of OH (~3400 cm⁻¹) and carbonyl groups (1699 cm⁻¹). The ¹H and ¹³C NMR data of **5** closely resembled those of **2**, except for the presence of an oxymethylene group [δ_H 3.25 (2H, s); δ_C 73.2] instead of a tertiary methyl group in **2**. The HMBC correlations of H₂-29 (δ_H 3.25) and H₃-30 (δ_H 3.25) to C-19, C-20, and C-21 revealed that the oxymethylene and methyl groups were attached to C-20. In addition,

R = trans-cinnamoyl

Figure 1. Key NOESY correlations of *O-trans*-cinnamoylglutinol (1).

NOE correlation of H₃-30 to H-18 indicated that the H₃-30 was β -oriented. Hence, compound **5** was established as 22 β ,29-dihydroxyl-12-oleanen-3-one. As to the structure of **4**, its IR and NMR data were similar to those of **5**, except for the C-22 substituent. In the HMBC spectrum, correlations of H₃-28 (δ _H 1.01) and H₂-21 (δ _H 2.00, 2.58) to δ _C 217.0 indicated that the carbonyl group was attached to C-22. Thus, compound **4** was identified as 29-hydroxy-12-oleanene-3,22-dione.

The molecular formula of 6, C₃₀H₄₆O₂, was established from HREIMS and ¹³C NMR data. Its IR spectrum indicated the presence of isolated and conjugated ketone groups (1709, 1678 cm⁻¹). ¹H NMR data showed five methyl singlets ($\delta_{\rm H}$ 0.88, 0.97, 1.02, 1.08, 1.85), a secondary methyl group at $\delta_{\rm H}$ 0.87 (3H, d, J = 5.6 Hz), terminal methylene protons at $\delta_{\rm H}$ 5.94 (1H, br s) and 5.73 (1H, br s), and two doublet protons for a cyclopropyl CH₂ group at $\delta_{\rm H}$ 0.55 (1H, d, J = 4.3 Hz) and 0.76 (1H, d, J = 4.3 Hz), indicating a cycloartane skeleton. The mass spectrum showed fragment ions at m/z 313 [M - C₈H₁₃O (side chain)]⁺ and 175 [M - C₁₇H₂₇O₂ (side chain + ring A)]⁺. The HMBC spectrum of **6** showed longrange correlations from H₂-22, H₂-26, and H₃-27 to C-24; from H₃-21 to C-17 and C-22; and between H₃-18 and C-17. These results suggested that 6 possessed a C8-side-chain with a conjugated carbonyl group [UV (MeOH) λ_{max} 224 and 261 nm] on the fivemembered ring. On the other hand, in the HMBC spectrum, the signals of H₃-28 and H₃-29 correlated with that of the oxo group ($\delta_{\rm C}$ 216.6), indicating that the oxo group was located at C-3 and which caused the H₂-19 signals of the cyclopropane ring to appear downfield to $\delta_{\rm H}$ 0.76 (d, J = 4.3 Hz, H_{endo}) and 0.55 (d, J = 4.3Hz, H_{exo}), respectively.⁸ Thus, compound **6** was identified as 25cycloartene-3,24-dione. This is the first report of 6 from a natural source; however, Dierassi and McCrindle had prepared this compound from 3β -hydroxy-24-cycloartene with chromic acid in acetone.3

Compound **7** had the molecular formula $C_{30}H_{48}O_2$ based on HREIMS and ¹³C NMR data. Its IR spectrum indicated the presence of OH (3423 cm⁻¹) and oxo (1706 cm⁻¹) groups. ¹H NMR data of **7** were similar to those of **6**, except for the presence of an OH group [$\delta_{\rm H}$ 4.00 (1H, t, J = 6.6 Hz)] instead of an oxo group. This oxymethine proton was assigned at C-24 due to its chemical shift and coupling pattern as well as HMBC correlation to C-25, -26, and -27. ¹H and ¹³C data suggested that **7** was 24ξ -hydroxy-25-cycloarten-3-one, not previously isolated from natural sources,

though it had been prepared from cycloartenone by biotransformation using the fungus *Glomerella fusarioides*.⁴

The molecular formula of 8, C9H10O4, was established from HREIMS and ¹³C NMR data. The IR spectrum suggested that 8 was a benzenoid (1626, 1510, and 1471 cm⁻¹) bearing a hydroxyl (3441 cm⁻¹) functionality. The ¹H NMR spectrum (Table 2) showed signals for one methyl group $[\delta_{\rm H} 2.09 (3 {\rm H}, {\rm s}, {\rm H}_3-7)]$, one methoxy group [$\delta_{\rm H}$ 3.84 (3H, s, H₃-8)], one methylenedioxy group [$\delta_{\rm H}$ 5.85 (2H, s, H₂-9)], and a single aromatic proton resonance [$\delta_{\rm H}$ 6.23 (1H, s, H-6)]. The HMBC spectrum of 8 revealed that the methylenedioxy proton signal H₂-9 ($\delta_{\rm H}$ 5.85, s) coupled to C-2 ($\delta_{\rm C}$ 133.3) and C-3 (δ_{C} 138.4), the H-6 signal (δ_{H} 6.23) coupled to C-1 (δ_{C} 134.3), C-2 (δ_{C} 133.3), C-4 (δ_{C} 135.7), and C-5 (δ_{C} 124.0), the H₃-8 signal ($\delta_{\rm H}$ 3.84) coupled to C-4 ($\delta_{\rm C}$ 135.7), and the H₃-7 signal ($\delta_{\rm H}$ 2.09) coupled to C-4 ($\delta_{\rm C}$ 135.7), C-5 ($\delta_{\rm C}$ 124.0), and C-6 ($\delta_{\rm C}$ 111.6). In combination with the HMBC assignments, mutual correlations including H-6/H₃-7 and H₃-7/H₃-8 in the NOESY spectrum helped to confirm both $\delta_{\rm C}$ 111.6/ $\delta_{\rm C}$ 138.4 and $\delta_{\rm C}$ 124.0/ $\delta_{\rm C}$ 133.3 should be *para*-oriented. The locations of all functionalities borne by the benzene ring were thus determined. Accordingly, compound 8 was identified as 2,3-(methylenedioxy)-4-methoxy-5-methylphenol.

Compound 9 was assigned as $C_{10}H_{14}O_4$ (M⁺; *m/z* 198.0885) by HREIMS. Analysis of the IR spectrum of 9 suggested that it contained a hydroxyl group (3421 cm⁻¹) and a benzene ring (1605, 1508 cm⁻¹). The ¹H NMR spectrum (Table 2) showed that **9** has a methyl group [$\delta_{\rm H}$ 2.21 (3H, s, H₃-7)] and three methoxyl groups $[\delta_{\rm H} 3.76 (3H, s, H_3-8), 3.86 (3H, s, H_3-9), and 3.79 (3H, s, H_3-10)]$ attached to an aromatic functionality, and a single proton signal at $\delta_{\rm H}$ 6.22 (1H, s, H-4). Heteronuclear long-range correlations [$\delta_{\rm H}$ 6.22 (H-4) coupled to $\delta_{\rm C}$ 134.5 (C-2), 148.5 (C-3), 125.7 (C-5), 139.8 (C-6); $\delta_{\rm H}$ 2.21 (H₃-7) coupled to $\delta_{\rm C}$ 125.7 (C-5), 104.4 (C-4), 139.8 (C-6); $\delta_{\rm H}$ 3.76 (H₃-8) coupled to C-6, $\delta_{\rm H}$ 3.86 (H₃-9) coupled to C-2; $\delta_{\rm H}$ 3.79 (H₃-10) coupled to C-3] in combination with the NOESY techniques (H-4/H₃-7, H₃-10; H₃-7/H₃-8) corroborated the locations of four functional groups on the benzene ring. The remaining hydroxyl group must be located at C-1, as evidenced from the analysis of above spectral interpretations. Conclusively, compound 9 was established as 2,3,6-trimethoxy-5methylphenol.

Experimental Section

General Experimental Procedures. Melting points were determined on a Yanaco MP-S3 micromelting point apparatus without correction. Optical rotations were measured on a JASCO DIP-1000 digital polarimeter in MeOH at 25 °C. UV spectra were taken on a Hitachi UV-3210 spectrophotometer. IR spectra were recorded on a Nicolet Magna-IR 550 spectrophotometer. ¹H and ¹³C NMR spectra were recorded on a Bruker Avance 500 spectrometer, and the solvent resonance was used as internal shift reference. EIMS and HREIMS were determined on a Finnigan TSQ-46C and JEOL SX-102A mass spectrometers. Column chromatography was carried out with silica gel (70–230 and 230–400 mesh, Merck 7734). HPLC was run on a GBC LC-1440 instrument equipped with a refractive index (RI) detector. **Plant Material.** The whole plant of *D. laxiflora* was collected in Taitong County, Taiwan, in December 2001. The plant material was identified by Prof. Shang-Tzen Chang of School of Forestry and Resource Conservation, National Taiwan University, and a voucher specimen was deposited at the herbarium of School of Forestry and Resource Conservation, National Taiwan University, Taipei, Taiwan.

Extraction and Isolation. Air-dried pieces of the whole plant of D. laxiflora (11.7 kg) were extracted with MeOH (140 L) by soaking for 1 week each at room temperature two times. The extract was filtered under vacuum and concentrated in a rotary evaporator to a residue (400 g). The residue was suspended in H₂O and partitioned successively with EtOAc and n-BuOH to yield EtOAc (100 g), n-BuOH (83 g), and H₂O (217 g) soluble fractions. The EtOAc-soluble fraction was subjected to chromatography using a Geduran Si-60 (Merck, Darmstadt, Germany) column eluted with EtOAc/n-hexane (gradient elution by changing from 5/95 to 100/0) to give fractions 1 (8.7 g), 2 (10.1 g), 3 (11.2 g), 4 (9.3 g), 5 (8.7 g), 6 (9.3 g), 7 (7.5 g), 8 (4.5 g), and 9 (2.2 g). The fractions were further separated by semipreparative HPLC on a model GBC LC-1440 instrument with a 250 \times 10.0 mm i.d., 5 μ m Luna Si-60 column (Phenomenex, Torrance, CA). Compounds 1 (6.0 mg) and 6 (6.1 mg) were eluted from fraction 1 with 5% EtOAc in n-hexane. Compounds 2 (8.1 mg), 3 (4.0 mg), and 7 (6.2 mg) were eluted from fraction 3 with 15% EtOAc in n-hexane. Compounds 8 (46.5 mg) and 9 (25.3 mg) were eluted from fraction 4 with 20% EtOAc in *n*-hexane. Compound 4 (7.4 mg) was eluted from fraction 6 with 40% EtOAc in n-hexane. Compound 5 (7.0 mg) was eluted from fraction 7 with 60% EtOAc in n-hexane.

O-trans-Cinnamoylglutinol (1): white solid; mp 97–98 °C; $[\alpha]^{25}_{\rm D}$ +59.0 (*c* 0.33, CH₃OH); UV (MeOH) $\lambda_{\rm max}$ (log ε) 276 (4.59), 221(4.41), 215(4.50) nm; IR (KBr) $\nu_{\rm max}$ 2935, 2865, 1709, 1645, 1455, 1385, 1310, 1171 cm⁻¹; ¹H NMR (CDCl₃, 500 MHz) δ 7.61 (1H, d, *J* = 16.0 Hz, H-3'), 7.48 (2H, m, H-5', H-9'), 7.36 (3H, m, H-6', H-7', H-8'), 6.38 (1H, d, *J* = 16.0 Hz, H-2'), 5.58 (1H, br d, *J* = 5.6 Hz, H-6), 4.82 (1H, br t, *J* = 2.4 Hz, H-3), 1.16 (3H, s, H-28), 1.12 (3H, s, H-26), 1.11 (3H, s, H-23), 1.09 (3H, s, H-24), 1.01 (3H, s, H-27), 0.98 (3H, s, H-30), 0.95 (3H, s, H-29), 0.91 (3H, s, H-25); ¹³C NMR data, see Table 1; EIMS *m*/*z* 556 [M⁺] (8), 408 (100), 393 (31), 341 (11), 283 (23), 274 (86), 259 (70), 218 (24), 205 (22), 187 (15), 173 (19), 131 (33); HREIMS *m*/*z* 556.4271 (calcd for C₃₉H₅₆O₂, 556.4266).

22β-Hydroxy-12-oleanen-3-one (2): white solid; mp 242–243 °C; [α]²⁵_D +29.1 (*c* 0.50, CH₃OH); IR (KBr) ν_{max} 3476, 2946, 2866, 1699, 1461, 1388, 760 cm⁻¹; ¹H NMR (CDCl₃, 500 MHz) δ 5.26 (1H, t, *J* = 3.6 Hz, H-12), 3.43 (1H, t, *J* = 5.2 Hz, H-22), 2.52 (1H, ddd, *J* = 15.5, 11.0, 7.5 Hz, Ha_x-2), 2.36 (1H, ddd, *J* = 15.5, 6.3, 7.5 Hz, H_{cq}-2), 2.09 (1H, br d, *J* = 14.5 Hz, H-18), 1.11 (3H, s, H-27), 1.08 (3H, s, H-23), 1.06 (3H, s, H-25), 1.04 (3H, s, H-24), 1.02 (3H, s, H-30), 0.97 (3H, s, H-26), 0.89 (3H, s, H-29), 0.86 (3H, s, H-28); ¹³C NMR data, see Table 1; EIMS *mlz* 440 [M⁺] (8), 234 (100), 219 (44), 216 (21), 176 (24); HREIMS *mlz* 440.3650 (calcd for C₃₀H₄₈O₂, 440.3642).

15α,16α-Epoxy-12-oleanen-3-ol (3): white solid; mp 251–252 °C; [α]²⁵_D +33.1 (*c* 0.30, CH₃OH); IR (KBr) ν_{max} 3423, 2946, 2926, 2866, 1666, 1461, 1388, 765 cm⁻¹; ¹H NMR (CDCl₃, 500 MHz) δ 5.27 (1H, t, *J* = 3.6 Hz, H-12), 3.21 (1H, dd, *J* = 11.6, 4.5 Hz, H-3), 2.89 (1H, d, *J* = 3.5 Hz, H-15), 2.77 (1H, d, *J* = 3.5 Hz, H-16), 2.08 (1H, t, *J* = 12.8 Hz, H_{ax}-19), 1.25 (3H, s, H-27), 0.99 (3H, s, H-23), 0.91 (3H, s, H-26), 0.89 (3H, s, H-22), 0.87 (3H, s, H-29), 0.83 (3H, s, H-30), 0.78 (3H, s, H-24); ¹³C NMR data, see Table 1; EIMS *m/z* 440 [M⁺] (29), 425 (35), 410 (29), 392 (24), 379 (12), 232 (86), 217 (24), 207 (58), 190 (35), 189 (31), 175 (31), 121 (24), 108 (100), 95 (27), 81 (26), 69 (33); HREIMS *m/z* 440.3649 (calcd for C₃₀H₄₈O₂, 440.3642).

29-Hydroxy-12-oleanene-3,22-dione (4): white solid; mp 255–256 °C; $[\alpha]^{25}_{D}$ +25.4 (*c* 0.55, CH₃OH); IR (KBr) ν_{max} 3436, 2956, 1706, 1699, 1467, 1388, 765 cm⁻¹; ¹H NMR (CDCl₃, 500 MHz) δ 5.33 (1H, t, *J* = 3.3 Hz, H-12), 3.33, 3.31 (each 1H, d, *J* = 10.7 Hz, H-29), 2.58 (1H, d, *J* = 14.1 Hz, H_{ax}-21), 2.53 (1H, ddd, *J* = 15.4, 11.0, 7.4 Hz, H_{ax}-2), 2.38 (1H, ddd, *J* = 15.4, 6.5, 3.4 Hz, H_{eq}-2), 2.24 (1H, t, *J* = 13.8 Hz, H_{ax}-19), 1.21 (3H, s, H-27), 1.08 (3H, s, H-23), 1.06 (3H, s, H-25), 1.04 (3H, s, H-24), 1.01 (3H, s, H-28), 1.00 (3H, s, H-26), 0.86 (3H, s, H-30); ¹³C NMR data, see Table 1; EIMS *mlz* 454 [M⁺] (13), 439 (7), 248 (100), 220 (39), 217 (54), 205 (26), 187 (20), 161 (45), 135 (30), 133 (36), 119 (37), 107 (29), 55 (39); HREIMS *mlz* 454.3440 (calcd for C₃₀H₄₈O₃, 454.3435).

22\beta,29-Dihydroxy-12-oleanen-3-one (5): white solid; mp 258–259 °C; $[\alpha]^{25}_{D}$ +58.2 (*c* 0.25, CH₃OH); IR (KBr) ν_{max} 3397, 2956, 2933,

2866, 1699, 1476, 1388, 1036, 765 cm⁻¹; ¹H NMR (CDCl₃, 500 MHz) δ 5.28 (1H, t, J = 3.2 Hz, H-12), 3.48 (1H, dd, J = 5.2, 3.3 Hz, H_{eq}-22), 3.25 (2H, s, H-29), 2.52 (1H, ddd, J = 15.9, 10.9, 7.4 Hz, H_{ax}-2), 2.36 (1H, ddd, J = 15.9, 7.0, 3.7 Hz, H_{eq}-2), 2.15 (1H, br d, J = 12.3Hz, H-18), 1.11 (3H, s, H-27), 1.07 (3H, s, H-23), 1.05 (3H, s, H-25), 1.04 (3H, s, H-30), 1.03 (3H, s, H-24), 1.01 (3H, s, H-26), 0.93 (1H, dd, J = 13.2, 3.1 Hz, H_{eq}-19), 0.82 (3H, s, H-28); ¹³C NMR data, see Table 1; EIMS m/z 456 [M⁺] (6), 425 (21), 412 (24), 250 (100), 219 (65), 201 (24), 135 (35), 121 (31), 119 (31), 107 (32), 95 (31), 81 (32), 55 (45); HREIMS m/z 456.3597 (calcd for C₃₀H₄₈O₃, 456.3591).

25-Cycloartene-3,24-dione (6): white solid; mp 128–130 °C; $[\alpha]^{25}$ _D +22.1 (c 0.29, CH₃OH); UV (MeOH) λ_{max} (log ε) 261 (3.36), 224 (3.71) nm; IR (KBr) $\nu_{\rm max}$ 2944, 2866, 1709, 1678, 1460, 1449, 1382 cm⁻¹; ¹H NMR (CDCl₃, 500 MHz) δ 5.94, 5.73 (each 1H, br s, H-26), 1.85 (3H, br s, H-27), 1.08 (3H, s, H-28), 1.02 (3H, s, H-29), 0.97 (3H, s, H-18), 0.88 (3H, s, H-30), 0.87 (3H, d, J = 5.6 Hz, H-21), 0.76, 0.55 (each 1H, d, J = 4.3 Hz, H-19); ¹³C NMR (CDCl₃, 125 MHz) δ 212.6 (C-3), 202.8 (C-24), 144.6 (C-25), 124.2 (C-26), 52.3 (C-17), 50.2 (C-4), 48.7 (C-14), 48.4 (C-5), 47.9 (C-8), 45.4 (C-13), 37.5 (C-2), 35.8 (C-20), 35.5 (C-15), 34.7 (C-23), 33.4 (C-1), 32.8 (C-12), 31.0 (C-22), 29.5 (C-19), 28.1 (C-7), 26.7 (C-11), 26.0 (C-10), 25.8 (C-16), 22.2 (C-29), 21.5 (C-6), 21.1 (C-9), 20.8 (C-28), 19.3 (C-30), 18.1 (C-18, C-21), 17.7 (C-27); EIMS m/z 438 [M⁺] (8), 414 (13), 363 (20), 313 (37), 231 (28), 199 (32), 197 (82), 175 (39), 149 (34), 149 (43), 135 (52), 121 (62), 107 (63), 95 (87), 91 (86), 81 (68), 89 (74), 59 (59), 55 (100); HREIMS *m/z* 438.3492 (calcd for C₃₀H₄₆O₂, 438.3486).

24*ξ***-Hydroxy-25-cycloarten-3-one (7):** white solid; mp 118–120 °C; $[\alpha]^{25}_{D}$ +20.8 (*c* 0.43, CH₃OH); IR (KBr) ν_{max} 3423, 2946, 2866, 1706, 1465, 1453, 1368 cm⁻¹; ¹H NMR (CDCl₃, 500 MHz) δ 4.90, 4.82 (each 1H, br s, H-26), 4.00 (1H, t, *J* = 6.6 Hz, H-24), 1.70 (3H, br s, H-27), 1.08 (3H, s, H-28), 1.02 (3H, s, H-29), 0.97 (3H, s, H-18), 0.88 (3H, s, H-30), 0.87 (3H, d, *J* = 5.6 Hz, H-21), 0.76, 0.55 (each 1H, d, *J* = 4.3 Hz, H-19); ¹³C NMR (CDCl₃, 125 MHz) δ 216.6 (C-3), 147.5 (C-25), 111.4 (C-26), 76.7 (C-24), 52.2 (C-17), 50.2 (C-4), 48.7 (C-14), 48.4 (C-5), 47.9 (C-8), 45.3 (C-13), 37.5 (C-2), 36.0 (C-15), 35.5 (C-20), 33.4 (C-1), 32.8 (C-12), 31.9 (C-22), 31.5 (C-23), 29.5 (C-19), 28.0 (C-7), 26.7 (C-11), 26.0 (C-10), 25.8 (C-16), 22.2 (C-17), 26.7 (C-21), 26.8 (C-16), 22.2 (C-17), 26.7 (C-10), 25.8 (C-16), 22.2 (C-17), 26.7 (C-21), 26.7 (

28), 21.5 (C-6), 21.1 (C-9), 20.8 (C-29), 19.3 (C-30), 18.3 (C-21), 18.1 (C-18), 17.2 (C-27); EIMS m/z 440 [M⁺] (12), 422 (27), 407 (20), 313 (57), 302 (18), 217 (20), 203 (34), 201 (23), 175 (44), 161 (38), 147 (50), 135 (50), 121 (67), 107 (73), 95 (100), 93 (59), 81 (63), 67 (45), 55 (69); HREIMS m/z 440.3649 (calcd for C₃₀H₄₈O₂, 440.3642).

2,3-(Methylenedioxy)-4-methoxy-5-methylphenol (8): colorless crystal; mp 132–133 °C; UV (MeOH) λ_{max} (log ε) 281 (3.40) nm; IR (KBr) ν_{max} 3441, 1628, 1510, 1471, 1231, 1060, 1026 cm⁻¹; ¹H and ¹³C NMR data, see Table 2; EIMS *m*/*z* 182 [M⁺] (100), 167 (90), 137 (33), 69 (29); HREIMS *m*/*z* 182.0575 (calcd for C₉H₁₀O₄, 182.0576).

2,3,6-Trimethoxy-5-methylphenol (9): colorless crystal; mp 128–129 °C; UV (MeOH) λ_{max} (log ε) 276 (3.36) nm; IR (KBr) ν_{max} 3421, 2938, 1605, 1508, 1472, 1233, 1130, 1089; ¹H and ¹³C NMR data, see Table 2; EIMS *m*/*z* 198 [M⁺] (58), 183 (100), 155 (80), 140 (82), 137 (40); HREIMS *m*/*z* 198.0885 (calcd for C₁₀H₁₄O₄, 198.0888).

Acknowledgment. This research was supported by grants from the National Science Council of the Republic of China. We thank Ms. S.-L. Huang and S.-Y. Sun for the NMR data acquisition and HREIMS measurement in the Instrumentation Center of the College of Science, National Taiwan University.
